(57) **ABSTRACT**

The present disclosure relates to a compact keyboard, monitor, and mouse (KMM) system for use in an equipment rack. The system includes a tray subsystem including a pair of drawer slides configured to mate with the equipment rack, each drawer slide having a bottom plane parallel to the ground when installed in the equipment rack. The system further includes a console housing supported by the tray subsystem. The console housing has a top surface that defines recesses for a keyboard and a monitor. The system also includes a keyboard. When secured in the keyboard recess, the keyboard is positioned parallel to the bottom plane of the tray subsystem. When positioned in the monitor recess, the monitor is canted at an angle relative to the bottom plane of the tray subsystem. The angle is selected to minimize the overall height of the KMM system while maximizing user ergonomics.
