(57) **ABSTRACT**

A timing method for determining hybrid automatic repeat request (HARQ) feedback information, and the method includes: determining, by a terminal device, a time position where the HARQ feedback information is located according to indication information indicating that a value number is greater than a value indicated by a timing indication domain from a physical downlink shared channel (PDSCH) to the HARQ feedback information in downlink control information (DCI), or determining a time position where the feedback information is located according to indication information configured to instruct a terminal device according to a predefined rule.
