(57) **ABSTRACT**

There is provided a management function network node and an associated method comprising the steps of obtaining (**512**) non-public land mobile network (PLMN) information wherein the non-PLMN information comprises information about network resources for a network other than a PLMN; determining (**514**) that at least one radio resource should be modified by a PLMN based on the obtained non-PLMN information, and transmitting (**516**) an indication of the at least one radio resource to the PLMN. There is furthermore provided a network node and an associated method comprising the steps of receiving (**612**) an indication from a management function that at least one radio resource used by the base station should be modified; transitioning (**614**) one or more wireless devices to or from the at least one radio resource; and modifying (**616**) the at least one resource.
