(57) **ABSTRACT**

This disclosure provides systems, methods and apparatuses for controlling user equipment (UE) functionality according to a second cell type bias mode, associated with the UE being within a coverage area of first and second cells of first and second cell types of a network. In some examples, the first cell type may operate in at least a first frequency band and according to a first communication mode and the second cell type may operate in at least a second frequency band and according to a second communication mode. The second cell type bias mode may correspond with a bias favoring the second cell type, the second communication mode, or combinations thereof.
