(57) **ABSTRACT**

The invention relates to an electrical conductor for a stator of a rotary electric machine, in the form of a U-shaped hairpin, having: —first and second legs intended to extend axially in a first slot A and a second slot R, respectively, of the stator, —a bundle portion connected to the first and second legs of the electrical conductor in each case by an oblique portion, —the two oblique portions being in the form of a helical portion.
