(57) **ABSTRACT**

An apparatus for a non-combustible aerosol provision system is described comprising: a charging unit configured to charge a battery of said aerosol provision system; a circuit comprising a control module, wherein the control module outputs a first control signal having a charge enable state and a charge disable state; and a protection module configured to decouple the circuit from said battery when the battery voltage is below a first threshold level. The charging unit is configured to charge the battery unless the first control signal has the charge disable state.
