(57) **ABSTRACT**

An access node, method and computer program product for: receiving from a terminal device served by a first access node measurement data relating to a plurality of radio beams, determining that the measurement data comprises data relating to at least one radio beam provided by at least one second access node, receiving information relating to angular coverage of the at least one radio beam provided by at least the second access node, determining, based on the angular coverage and the measurement data relating to the plurality of radio beams, an estimated location of the terminal device, and selecting a set of radio beams for provision to the estimated location of the terminal device, wherein the set of radio beams comprises a subset of radio beams provided by the first access node for serving the terminal device.
