ABSTRACT

Embodiments of the present application relate to a method and apparatus for sidelink DRX alignment. An exemplary method includes: obtaining configuration information indicating at least one DRX configuration for a data, wherein the at least one DRX configuration is associated with a first resource pool; and transmitting or receiving the data based on the at least one DRX configuration indicated by the configuration information. Embodiments of the present application can minimize the power consumption of the UEs as well as ensuring the data transmission among the UEs.
