(57) **ABSTRACT**

An electronic atomization device includes: a heating element; and a control module for: controlling the heating element to heat in a heating period of a first time segment of a current time window, and detecting a resistance value of the heating element in a non-heating period of the first time segment of the current time window; controlling the heating element to heat in a heating period of an intermediate time segment of the current time window, and controlling the heating element to stop heating or detect the resistance value of the heating element in a non-heating period of the intermediate time segment of the current time window; and controlling the heating element to heat in a heating period of a final time segment of the current time window. The intermediate time segment is a different time segment than the first and final time segments in the current time window.
