(57) **ABSTRACT**

In a component adsorption nozzle, the nozzle can be attached to both of the in-line shaft and the rotary shaft by utilizing the outside (outer wall) of the nozzle body for attaching to the in-line shaft and utilizing the inside (inner wall) of the nozzle body for attaching to the rotary shaft. Therefore, for a user who owns each of the in-line type and rotary type component mounters, it is not necessary to prepare a nozzle dedicated to each type component mounter and it is possible to reduce the burden required for preparing the nozzle.
