(57) **ABSTRACT**

Methods and apparatuses for sidelink (SL) positioning within network coverage in a wireless communication system. A method of operating a user equipment (UE) includes receiving, via a downlink (DL) interface, configuration information for a sidelink (SL) positioning reference signal (PRS) and determining, based on the configuration information, resources for the SL PRS on a SL interface. The method further includes transmitting, via the SL interface, an indication of the resources for the SL PRS and transmitting the SL PRS on the indicated resources.
