ABSTRACT

(73) Assignee: **NICHIA CORPORATION**, Anan-shi
(JP)

A light-emitting device includes a light-emitting element; a base member having a first surface where the light-emitting element is disposed, a second surface opposite to the first surface, a lateral wall; a light-transmissive member disposed over the base member to cover the first surface; and a bonding member between a lower surface of the light-transmissive member and an upper surface of the lateral wall, the base member having a first electrode portion, a second electrode portion spaced apart from the first electrode portion, and electrode distinguishing marks respectively provided in vicinities of two adjacent angles of the rectangular outer shape on the upper surface, a portion of the light-transmissive member overlapping with at least a portion of each of the two electrode distinguishing marks in the top view, and the bonding member not disposed at least in the vicinities of the two adjacent angles on the upper surface.
