In one aspect, a charging device includes a plug, a platform defining one or more planar surfaces, a leg having a bottom end coupled to the plug and a top end coupled to the platform with a length measured between the top and bottom ends and a minimum width that is less than one-third of a width of the platform, and one or more chargers. The plug is configured to be received into a receptacle on a wall such that the one or more chargers are in electrical communication with the receptacle, the leg extends between the receptacle and the platform along the wall, and the platform projects outwardly from the wall such that each of the one or more planar surfaces is substantially perpendicular to the wall and the width of the platform is substantially parallel to the wall. Other aspects and features are described.
