ABSTRACT

A feedback method includes: when a first physical uplink control channel PUCCH cell group corresponding to a terminal includes at least two PUCCH cells that can be used to transmit hybrid automatic repeat request acknowledgement HARQ-ACK, and the PUCCH cells corresponding to the terminal perform semi-static switching based on a time domain pattern, performing, by the terminal, a first operation on first HARQ-ACK, where the first HARQ-ACK is HARQ-ACK for semi-persistent scheduling SPS; performing, by the terminal, a first processing operation on the first HARQ-ACK based on the first operation, where the first processing operation includes one of the following: sending the first HARQ-ACK; or executing first behavior related to the first HARQ-ACK; and the first operation includes at least one of the following: determining a target PUCCH cell corresponding to the first HARQ-ACK; or determining a target PUCCH resource corresponding to the target PUCCH cell.

Publication Classification

(51) **Int. Cl.**

H04L 1/1812 (2006.01)

H04W 72/11 (2006.01)

When a first physical uplink control channel PUCCH cell group corresponding to a terminal includes at least two PUCCH cells that can be used to transmit hybrid automatic repeat request acknowledgement HARQ-ACK, and the PUCCH cells corresponding to the terminal perform semi-static switching based on a time domain pattern, the terminal performs a first operation on first HARQ-ACK, where the first HARQ-ACK is HARQ-ACK for semi-persistent scheduling SPS

201

The terminal performs a first processing operation on the first HARQ-ACK based on the first operation, where the first processing operation includes one of the following: sending the first HARQ-ACK; or executing first behavior related to the first HARQ-ACK
