(57) **ABSTRACT**

Disclosed is a portable electronic device including a flexible display, a shutter frame arranged on a back surface of the flexible display, a middle frame arranged on a back surface of the shutter frame, a sub-board connected to an end of the flexible display via a flexible substrate and arranged between the shutter frame and the middle frame, a main board and a battery arranged in a back surface of the middle frame, and a back cover that covers the main board and the battery and is coupled to the back surface of the middle frame, wherein the middle frame includes a front mounting portion protruding in a backward direction at a location corresponding to the sub-board, a back mounting portion defined at a location corresponding to the main board and the battery, and a shielding side wall between the back mounting portion and the front mounting portion.
