(57) **ABSTRACT**

A display panel can include a first area including a plurality of first pixels, and a second area including a pixel area including a plurality of second pixels and a plurality of camera hole areas disposed between the plurality of second pixels, in which each of the plurality of first pixels and the plurality of second pixels includes a light emitting element, and the light emitting element includes an anode layer and a cathode layer. Also, the cathode layer disposed in the second area includes openings, a density of the first pixels is different from a density of the second pixels, and metal electrode materials are surrounding the openings of the cathode layer in the second area and electrically connected to a pixel group in at least one of the plurality of camera hole areas.
