**ABSTRACT**

A display device according to an exemplary embodiment of the present disclosure includes a substrate that includes a non-active area and an active area, the non-active area including a bending area and a pad area. The display device also includes a gate driving circuit, a driving integrated circuit, and a plurality of lines connecting the driving integrated circuit to the gate driving circuit. The plurality of lines includes a first group of lines that transmits a signal having a first average voltage, a second group of lines that transmits a clock signal, and a third group of lines that transmits a signal having a second average voltage different from the first average voltage. The second group of lines is located between the first group of lines and the third group of lines.
