(57) **ABSTRACT**

A foldable sheet of an embodiment may include a body area including a first body and a second body spaced apart from the first body, a folding area positioned between the first body and the second body and folded in a first direction so that the first body and the second body face each other, a bending area including a first bending area for connecting one end of the folding area and the first body, and a second bending area for connecting the other end of the folding area and the second body. The bending area may have a structure which is bent at least twice to protrude in a second direction opposite to the first direction so that the first body and the second body are arranged in parallel to each other in a state where the folding area is unfolded.
