(57) **ABSTRACT**

A connection element is disclosed. In an embodiment, the connection element includes a guide element and first and second contact elements arranged at a distance from one another. The guide element at least partially surrounds the contact elements and is configured to guide and receive at least one mating connection element. The first and second contact elements have respective first and second contact sections configured for connection to a mating contact element of the mating connection element. The first and second contact sections lie on a straight connecting line which runs orthogonally through the first and second contact element axes and the contact sections have different lengths along a direction of the straight connecting line. A kit of parts and an electronic component part, each including at least one connection element as described, are also disclosed.
