A method, a device, and a non-transitory storage medium are described in which a video-based collaboration assistance service is provided. The service may include identifying a user profile for a user of a videoconferencing application to access a videoconferencing session. The service may convert statements expressed by participants of the videoconferencing session to text data. The service may determine an expressive context quality of the text data. The service may create, using the text data and the expressive context quality, discussion threads and corresponding expressive context indicators. The service may also generate, based on the user profile, a graphical interface including select ones of the discussion threads including one or more of the expressive context indicators for presenting via the videoconferencing application.
