(57) **ABSTRACT**

A facsimile transmission system includes circuitry to receive, from a user, a request for facsimile transmission of a document, and determine which one of first facsimile transmission and second facsimile transmission is to be performed, based on one of an attribute of the user, an attribute of a destination of the facsimile transmission, and an attribute of the document. The first facsimile transmission is transmitting the document by an image forming apparatus, and the second facsimile transmission is transmitting the document by a facsimile server. The circuitry further instructs to perform the one of the first facsimile transmission and the second facsimile transmission.
