(21) Appl. No.: **18/115,000**

The present application discloses a method and a device in a node for wireless communications. A first receiver receives a first signaling and a second signaling; and a first transmitter transmits a first signal in a target radio resource block, the first signal carrying a first bit block; wherein the first signaling is used to determine the first bit block, and the first signaling is used to determine a first radio resource block; the second signaling is used to determine a second radio resource block, the second radio resource block being reserved for a second bit block; the first bit block comprises at least one of first-type information bit(s) or second-type information bit(s); the second signaling comprises a first field; when the first bit block comprises the first-type information bit(s).
