ABSTRACT

A method of power management of one or more line
modules in a network device includes obtaining a power
rating of a line module of the one or more line modules;
determining, based on the power rating, one or more of a
current threshold and a shutdown voltage for the line mod-
ule; and providing the current threshold and the shutdown
voltage to the line module for storage thereon, wherein the
line module is configured to monitor the current threshold
and the shutdown voltage and operate based thereon.
