**ABSTRACT**

A feedback state indication method and apparatus, a terminal device and a network device are provided. The method includes: a terminal device receives RRC signaling sent by a network device, the RRC signaling carrying first indication information or second indication information. The first indication information is used for indicating that HARQ feedback is enabled or disabled, and the second indication information is used for indicating that the HARQ feedback is controlled by downlink control information to be enabled or disabled.

A terminal device receives a RRC signaling sent by a network device, the RRC signaling carrying first indication information or second indication information. The first indication information indicates that a HARQ feedback is enabled or disabled, and the second indication information indicates whether the HARQ feedback is enabled or disabled is controlled by DCI
