ABSTRACT

Provided is a display panel including a light-emitting device including a first electrode, a second electrode, and a light-emitting layer, a pixel defining layer having a light-emitting opening defined therein the pixel defining layer not covering at least a center portion of the first electrode, a separator disposed on the pixel defining layer and having a separating opening defined therein and overlapping the light-emitting opening, and a sensing electrode including a pattern portion overlapping the separator and a bridge portion electrically connected to the pattern portion. At least a portion of the pattern portion is disposed on the separator and electrically disconnected from the second electrode along an edge of the separator and the bridge portion is disposed on the pixel defining layer, wherein the bridge portion includes a first portion which overlaps the separator and a second portion which does not overlap the separator.
