ABSTRACT

The present invention relates to a formulation containing at least one organic functional material and at least a first organic solvent A, characterized in that the concentration of the at least one organic functional material in the formulation is ≥ 15 g/l, and the viscosity of the formulation is ≤ 10 mPas, to a process for the preparation of an electronic device, preferably an electroluminescent device, using this formulation as well as to an electronic device, preferably an electroluminescent device, prepared by using this formulation.
