**ABSTRACT**

A display device includes a lower substrate having a thin-film transistor disposed thereon; a plurality of upper substrates respectively having light-emitting elements disposed thereon, wherein the plurality of upper substrates are spaced apart from each other and are disposed on the lower substrate; conductive adhesive members disposed between the lower substrate and the upper substrates; a first filling material filling a space between the lower substrate and each of the upper substrates, wherein the first filling material covers the conductive adhesive members; and a second filling material filling a boundary area between adjacent ones of the plurality of upper substrates.
