(57) **ABSTRACT**

The present application provides a display panel and a display device. The display panel includes a substrate and a plurality of light-sensing units disposed on the substrate. The light-sensing unit includes a light-sensing transistor and a reading transistor connected in series. The light-sensing transistor includes a first active layer. The reading transistor includes a second active layer. A material of the first active layer and a material of the second active layer are both oxide semiconductors.
