**ABSTRACT**

Method and device in nodes used for wireless communication. The first node receives a first reference signal group; when a first condition is satisfied, transmits a first signal in a first radio resource group. A measurement performed on the first reference signal group is used to judge whether the first condition is satisfied; whether the first condition is satisfied is used to determine whether the first signal is transmitted; the first signal is used to determine a second reference signal; the first condition comprises that a value of a first counter is not less than a first threshold; a first reference signal is used to determine a spatial-domain relation of the first radio resource group; whether the first reference signal and the second reference signal are QCL is related to whether the second reference signal belongs to a first reference signal subset or belongs to a second reference signal subset.
