- (57) **ABSTRACT**

- (86) PCT No.: **PCT/JP2022/017305**

- A solid electrolyte having a garnet-type structure which contains Li, La, Zr, and O, in which, with respect to particles of the solid electrolyte having a particle size equal to or greater than the particle size at which the cumulative value of frequency in a volume-based particle size distribution reaches 10%, a number average of degrees of envelope of particles is 0.8 or greater, the degree of envelope being defined as a ratio (area within a contour of a particle/area within an envelope of the particle).
