(57) **ABSTRACT**

According to the present disclosure, a display device includes a lower substrate, and is formed of one of transparent conducting oxide and an oxide semiconductor, an inorganic layer disposed on the lower substrate, a planarization layer disposed on the inorganic layer, a bank disposed on the planarization layer, an adhesive layer disposed on the inorganic layer, the planarization layer, and the bank, and an upper substrate disposed on the adhesive layer, and the bank includes a first bank disposed in an area overlapping the lower substrate and a second bank disposed so as to enclose side surfaces of the first bank, the inorganic layer, the planarization layer, and the lower substrate. Accordingly, a moisture permeation characteristic of the display device may be improved and the crack generated in the outer peripheral area may be reduced.
