(57) **ABSTRACT**

An electronic device comprises a housing and a camera decoration assembly including a first decoration part and a second decoration. The second decoration part sleeves an outer side surface at an end, outside the housing, of the first decoration part, and an outer edge of the second decoration part extends to an outer surface of the housing, such that in addition to a camera decoration assembly having diverse appearance effects, a size of a hole formed in the housing can be decreased to enhance overall strength of the housing. Moreover, a form of connection between a buckle and a connection assembly facilitates disassembly, decreases occupied space, and can increase flexibility in disassembling the camera decoration assembly.
