ABSTRACT

A light emitting device includes a first electrode and a second electrode facing each other, a light emitting layer disposed between the first electrode and the second electrode, and the light emitting layer including quantum dots, wherein the light emitting layer includes a first light emitting layer proximate to the first electrode and a second light emitting layer proximate to the second electrode, the quantum dots of the first light emitting layer include a first ligand on a surface, and the quantum dots of the second light emitting layer include a second ligand on a surface, the first ligand different from the second ligand, a HOMO energy level of the first light emitting layer is lower (shallower) than a HOMO energy level of the second light emitting layer.
