An electronic device may comprise a chassis and an ejection mechanism coupled to the chassis. The chassis can house an electronic component and can be removably received within a system chassis of an electronic system. The ejection mechanism may be reversibly configurable between a first state and a second state. When the chassis is in an installed position in the system chassis and in the first state, actuation of an actuatable portion of the ejection mechanism from a first position to a second position moves the chassis from the installed position into an ejected position relative to the system chassis. But when the chassis is in the installed position in the system chassis and in the second state, actuation of the actuatable portion of the ejection mechanism from the first position to the second position does not move the device into the ejected position relative to the system chassis.
