The present application discloses a display panel, wherein the driving circuit layer includes a first transistor and a second transistor, the first light-emitting unit is arranged on a side of the driving circuit layer away from the flexible substrate, and is connected to the first transistor, and the first light-emitting unit emits light from a side away from the flexible substrate; wherein the second light-emitting unit is disposed on a side of the flexible substrate away from the driving circuit layer, and is connected to the second transistor through a connection hole penetrating through the flexible substrate, and the second light-emitting unit emits light from a side away from the flexible substrate.
