(57) **ABSTRACT**

An exemplary installation element for electrical connectors has a base housing in which at least one electrical plug socket is arranged, and an outer housing which has at least one through opening. A rotatable closure is arranged between the outer housing and the base housing. The installation element also has a drive motor and transmission which moves the closure linearly and rotationally, responsive to at least one control signal. The at least one through opening in the installation element can be opened and closed automatically without manual manipulation of the closure.
