**ABSTRACT**

An information processing system performs information processing related to chat-type communication among a plurality of users. The system includes one or more processors programmed to acquire sent content that is sent from a first user in a chat, and generate a plurality of options related to reply content from a second user with respect to the sent content. The plurality of options includes a first option associated with a destination in a virtual space displayed via an electronic device of the second user. The destination is determined based on the sent content.
