(57) **ABSTRACT**  
Systems and methods are described for identifying a plurality of candidate interactive sessions for a user with a user profile to join, each candidate interactive session being associated with a plurality of user profiles. A digital representation of the user may be generated, and the digital representation of the user may be caused to join each of the plurality of candidate interactive sessions. The systems and methods may monitor, in each candidate interactive session, behavior of digital representations of each of the plurality of user profiles associated with the candidate interactive session in relation to the digital representation of the user. The systems and methods may generate, based on the monitoring, a social inclusivity score for each of the plurality of candidate interactive sessions. A recommended interactive session may be selected and provided based on the corresponding social inclusivity score for each candidate interactive session.
