(57) **ABSTRACT**

The present disclosure provides a complete machine structure, including a display module and a complete machine exterior frame. The display module includes a display panel and a front frame, the front frame including a front frame side edge on an outer side of a side edge of the display panel. The complete machine exterior frame includes at least one outer frame side edge each located on a side of the front frame side edge away from the display panel, and in contact with the front frame side edge. When a total contact area of all outer frame side edges and corresponding front frame side edges satisfies a certain condition, heat transferred from the display module to the complete machine exterior frame can be reduced by controlling the total contact area.
