ABSTRACT

Embodiments include systems and methods that may be performed by a processor of a wireless device for managing a communication link with a communication network. Various embodiments may include determining whether a cause of a detected physical downlink shared channel (PDSCH) error in a downlink communication from a base station is an out of coverage condition, and initiating an autonomous handover from the base station to a second base station in response to determining that the cause of the PDSCH error is an out of coverage condition.
