(57) **ABSTRACT**

A method and system for transpositional modulation forti-
fied communication includes an original carrier of an RF
channel operating within a spectral mask. The original car-
rier has a carrier signal with a first quantity of data. At least
one transpositional modulation (TM) channel has a TM sig-
nal second quantity of data. The at least one TM channel is
added to the original carrier thereby generating a TM forti-
fied carrier signal having the first and second quantities of
data. The at least one TM channel and the original carrier do
not exceed the spectral mask. At least one device with a
receiver receives the TM fortified carrier signal.
