(57) **ABSTRACT**

According to an embodiment, a processor of an electronic device identifies a combination of a first projection area for the electronic device and a second projection area for an external electronic device. The processor displays a portion of a visual object for guiding a reference aspect ratio in the first projection area. The portion is segmented from the visual object based on a location of the first projection area in the combination. The processor adjusts the portion, based on the motion of the electronic device. The processor displays, based on identification of an aspect ratio of the combination being corresponded to the reference aspect ratio, at least portion of media content having the reference aspect ratio in the first projection area.
