ABSTRACT

An audio-visual system may include a housing comprising
an open upper end and a storage space, an audio-visual
device installed inside the housing and exposable through
the open upper end, and a lifting device configured to expose
or store the audio-visual device inside the housing through
the open upper end. The audio-visual device may include a
display, a speaker, and a processor configured to control the
audio-visual system to operate in a first mode for outputting
media art content while the display is stored in the housing
according to a first event, operate in a second mode for
outputting audio content through the speaker while part of
the display is exposed through the open upper end according
to a second event, and operate in a third mode for outputting
a visual content while the entire display is exposed through
the open upper end according to a third event.
