(57) **ABSTRACT**

The sound amplifier system disclosed herein can transmit discrete electronic output signals via discrete channels to different speaker types or different speaker sets. For example, in some situations a guitarist may want to play a clean tone through a speaker type designed to play clean tones. In other situations, a guitarist may want to play a distorted tone through a speaker type designed to play distorted tones. The sound amplifier system allows the guitarist to select which speaker type they wish to transmit their guitar output signal to depending on what sound they want to play. In addition, this disclosure also concerns various embodiments of a sound amplifier system which have articulating speakers that may be tilted vertically or horizontally.
