(57) **ABSTRACT**

This application relates to the terminal field, and discloses a notification method, a related apparatus, and a system. When sending notification information to a second electronic device, a first electronic device sends information about one or more controls (for example, an identifier corresponding to each of the one or more controls) related to the notification information. When the second electronic device receives an input operation for a first control of the one or more controls, the second electronic device may send an identifier corresponding to the first control to the first electronic device. After receiving the identifier corresponding to the first control, the first electronic device may determine, based on the identifier, an operation corresponding to the first control, and perform the operation. Therefore, a user may further process the notification information based on the second electronic device. This simplifies a user operation.
