(57) **ABSTRACT**

A display apparatus includes multiple light-emitting devices are disposed on a substrate, multiple color conversion layers disposed on the substrate and corresponding to the light-emitting devices, and multiple banks disposed between adjacent ones of the color conversion layers. Each of the banks includes first scattering particles, second scattering particles, and a polymer host. A refractive index ( $n_1$ ) of the first scattering particles is greater than a refractive index ( $n_0$ ) of the polymer host. The refractive index ( $n_1$ ) of the first scattering particles and a refractive index ( $n_2$ ) of the second scattering particles are different.
