(57)ABSTRACT

Briefly, example methods, apparatuses, and/or articles of manufacture may be implemented, in whole or in part, using one or more computing devices to obtain, from a communications device, an identifier of the communications device transmitted via a communications network. The communications network may transmit a request for one or more parameters unique to a subscriber of the communications network. The method may also include processing signals indicative of the requested one or more parameters in response to the subscriber entering the one or more parameters into a graphical user interface of the communications device. The method may further include transmitting, to the communications device, one or more signals to provide a complement of subscriber parameters.
