(57)ABSTRACT

A display device comprises pixels, each of the pixels comprising first to third sub-pixels. Each of the first to third sub-pixels comprises: first to fourth electrode spaced from each other; and an integrated light-emitting element electrically connected to the first to fourth electrodes. The integrated light-emitting element comprises: a first light-emitting element comprising a first end portion connected to the first electrode and a second end portion connected to the fourth electrode; a second light-emitting element comprising a first end portion connected to the second electrode and a second end portion connected to the fourth electrode; a third light-emitting element comprising a first end portion connected to the third electrode and a second end portion connected to the fourth electrode; and a shape memory polymer coupled to the second end portion of each of the first to third light-emitting elements.
