(57)**ABSTRACT**

A method operable by a vehicle processor comprises: causing a vehicle receiver to receive a radio broadcast channel; obtaining from the received radio broadcast channel, digital data comprising a respective identifier, transmitting location and broadcasting range for one or more other radio broadcast channels whose broadcasting range overlaps with a broadcasting range of the received radio broadcast channel; determining a location of the vehicle; determining if a broadcasting range of any of the or each other radio broadcast channels overlaps with a location of the vehicle; and outputting for display through a user interface, an indication of available radio broadcast channels including the or each of the other radio broadcast channels determined to have a broadcasting range overlapping with the location of the vehicle.
