#### (57)**ABSTRACT**

In a light emitting display device according to an embodiment of the present disclosure, lateral leakage current caused by a layer having high mobility in the device is prevented by changing an internal structure of a stack of light emitting elements. The light emitting display device of the disclosure includes a bank to expose a plurality of light emitting portions spaced apart from each other on a substrate, a first electrode at each of the plurality of light emitting portions and a second electrode to face the first electrode, a first stack, a second stack and a charge generation layer between the first electrode and the second electrode, and an optical compensation layer located between the charge generation layer and the first stack and in contact with the charge generation layer at at least one of the plurality of light emitting portions.
